

# FDVS\*

## Lyophilisation Vial System

\*Prototype

### High Quality Temperature and Vacuum Sensors

Ensures accurate control of environment

### Industry Standard Lyophilisation Vials

2R, 4R, 8R, 10R, 15R and 20R

### Real Time Imaging

Capture images of the sublimation front and freeze drying process

# Introducing the FDVS

The Freeze Drying Vial System (FDVS) has been optimised for simulating the industrial freeze drying process in a compact and efficient form. By incorporating the vials, the FDVS works with a small sample volume and uses enough to simulate large scale industrial processes while still minimising sample wastage. It saves time, money and the unit has also been designed to save space. It is mounted on an ergonomically designed table which houses controller units underneath and has the stage and imaging system.

The system was built with the scientific process in mind and as such comes with several specialised components which are essential to the freeze drying process. The optical system can be controlled in the X, Y, Z axis with a 10x darkfield lens mounted in line with the freeze drying stage. With this specially designed optical set-up, monitoring and tracking the position of the sublimation interface can be done simply and efficiently. Real time imaging allows the user to see structural changes in their samples as lyophilisation occurs in the vials. A cold trap has been built into the system to condense and remove any excess moisture. The system is fitted with two vacuum sensors, a capacitive and a pirani-type sensor which allows accurate sensing throughout the drying process and detection of the end point of primary drying. The top of the stage also features a vial stopper which allows the user to close the open vials once the freeze drying process is complete.

## Features

### **SIMULATE INDUSTRIAL PROCESSES**

Along with vacuum, temperature (-100°C to 125°C) can be accurately controlled and programmed to simulate industrial procedures and determine ideal drying parameters. The process is quick and utilises small volumes of sample, ultimately reducing sample wastage and saving on costs.

### **ACCURATE TEMPERATURE AND VACUUM SENSING**

The system is fitted with two vacuum sensor types ensuring accurate detection of the transition between primary and secondary drying. The dipping thermocouple accurately measures the temperature reading within the lyophilisation vials and a platinum sensor in the shelf provides accurate stage temperature detection.

### **REAL TIME IMAGING**

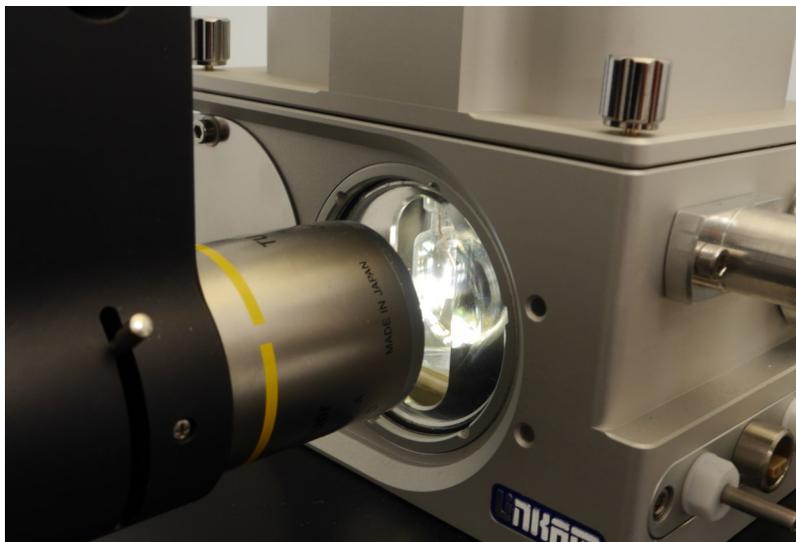

With the 10x Darkfield lens and control of the X, Y and Z axis, the system is optimised for capturing the freeze drying process. The arrangement of the optical set-up allows for structural changes to be seen as they occur in the lyophilisation vials

### **MULTIPLE VIAL COMPATIBILITY**

Compatible with most standard freeze drying vials (2R (up to seven vials), 4R, 8R, 10R, 15R and 20R).

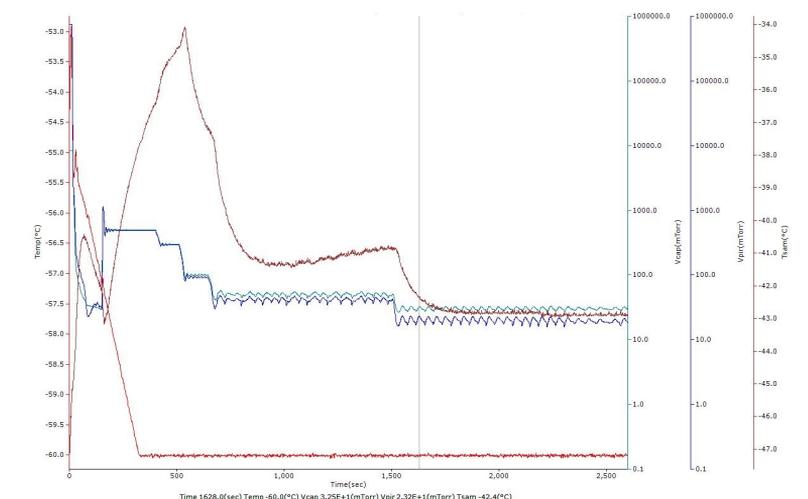

### **MOISTURE CAPTURE**

The built in cold trap captures excess moisture and removes it from the vacuum system.

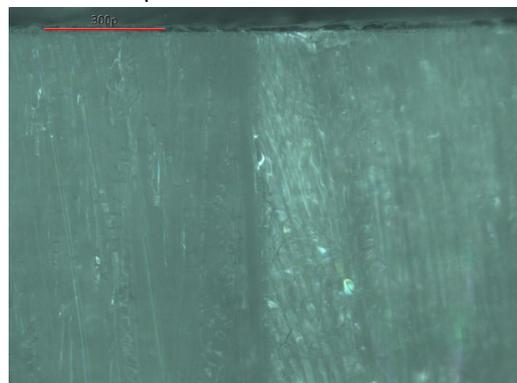

# Application Examples

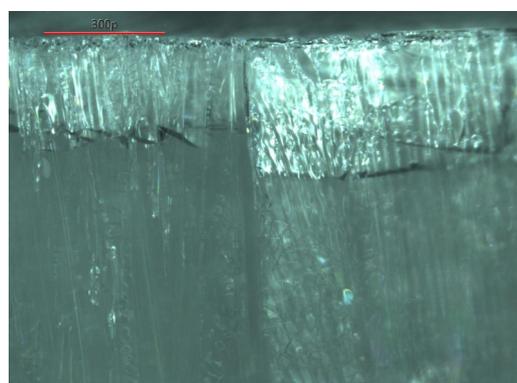

The FDVS allows full control over temperature and vacuum through customisable control profiles. Below is an example of a freeze-drying graph from the control software LINK. Two temperature readings are shown, one from within the lyophilisation vial and one of the stage shelf, together with the readings of both capacitive and pirani sensors.

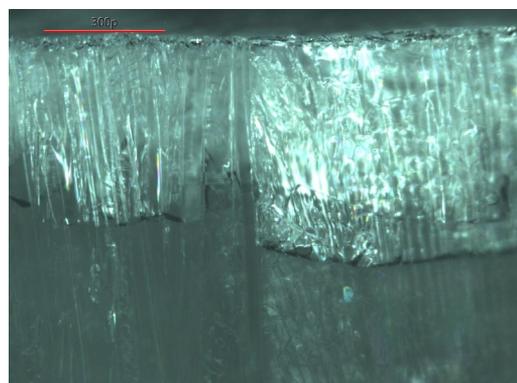

Below are still images of the drying front of a sucrose sample.

## Testimonial

**Dr Zixin Huang, University of Erlangen, Research Group of Dr H. Giesler**

“The idea of designing the FDVS system is not just to make a mini-scale freeze dryer but also to create a versatile platform, with which one is able to quantitatively evaluate the freeze-drying process under controlled condition within a single vial. The purpose of this system is to facilitate the freeze-drying cycle design and process transfer.

Process parameters such as sublimation rate and resistance to vapour flow can be determined during the drying process. By this means, the freeze-drying cycle under given condition could be quantitatively assessed. With the optical unit, which is equipped with a darkfield lens, one is also able to observe the freezing and drying process, which would be helpful for better understanding the drying behaviour”.

## Technical Specification\*

<b>Temperature Range</b>	-100°C to 50°C
<b>Heating Rate</b>	0.01°C to 30°C
<b>Block Type</b>	Silver Cooling Block
<b>Pressure Range</b>	40mTorr to Standard Pressure
<b>Compatible Vials</b>	2R (up to seven vials), 4R, 8R, 10R, 15R and 20R
<b>Pressure Sensors</b>	Pirani and Capacitive

\*subject to change

## Discover More...

### Humidity

The RH95 Relative Humidity Controller provides environmental sample control to Linkam's range of temperature stages. It provides precise control in a compact, self-contained package with no requirement for dry air supply. The RH% is accurately controlled between 10%-90% (temperature range ambient to 85°C).

### FDCS196

With a temperature range down to -196°C, ultra low temperature eutectics can be investigated with the FDCS196 system. Chamber pressure is monitored by a Pirani vacuum gauge mounted directly on the stage. A perfectly uniform vacuum is maintained, even when the XY manipulators are used to follow the drying front moving across the sample. Pressure can be automatically controlled by the new Linkam MV196 motorized valve. A graph of temperature against time also shows the plot of the chamber pressure throughout the experiment.

### Optical DSC

The optical Dual Pan DSC (Differential Scanning Calorimeter) system has been optimised for those wishing to measure the transition temperatures and enthalpy changes of their samples. The design allows mounting of the stage on a microscope, granting image and time lapse recording of sample transitions with high detail. An optically sealed crucible is also available for those wishing to conduct closed experiments. The Dual Pan DSC enables the user to measure thermal and glass transitions of a wide range of substances whilst accurately controlling temperature from -196°C to 450°C.

United Kingdom

We make scientific instruments that help characterise materials from polymers to biological tissue and metals to composites. Our instruments are used for research by the world's most advanced scientific organisations and companies. Each of our instruments are designed and manufactured in-house by our team of highly experienced electronics, software and mechanical design engineers. We design and develop solutions for sample characterisation by collaborating with the best scientists in the world. Will you be next?
